Abstract (Basic): FR 2669818 A

The dispenser for a cleaning material, e.g. absorbent paper towel used to dry the hands after washing, consists of a cylindrical housing with a flat base (1) for mounting on a vertical surface such as a wall, an inner spring-loaded flange (4), and an outer flange (2), with the roll (R) of material held between them. The flat base (1) has a central cylindrical projection with a truncated conical tip (13.2) which goes into the centre of the roll, while the outer flange (2) has a cylinder which projects inwards to overlap the conical tip and form a gap (e) through which the roller material is drawn as it unwinds from the centre of the roll.

An aperture in the centre of the outer flange receives a plate (14) with a notched or toothed hole in it which enables a section of material of the required length to be torn off.

ADVANTAGE - Design simplicity, combining reliability and practicality.
